Derwent Abstract: (JP5332665A) Through-holes (11a and 11b) formed in a side wall (10a and 10b) are set such that the opening area of each through-hole group is gradually decreased from the through-hole group on the upper part side of the side wall toward the through-hole group on the lower part side.
USE/**Advantage** - Blast pressure of air for defrosting and an opening area are in reverse proportion to each other, an amount of air to the defrosting chamber is balanced between the air amount at the upper and lower parts of the defreezing chamber. Defrosting speeds at the upper and lower parts ar emade equal to each other and unevenness in defrosting does not occur.
